

Honeywell Power Supply Ground Choke Installation

The Honeywell power supply kit comes with an additional ground wire choke. The ground choke is connected in series with your existing powercord ground wire and the metal chassis. This component is essential to protect the power supply. Earth/ground line choke eliminates ground loop frequencies. This prevents fault in your unit caused by ground conductor loops during power surge.

For Honeywell F50E and F50A series, the power box is different but the ground choke wire is installed in the same concept. Which ever ground wire you have supplied to your unit, install the ground choke in series with you ground wire and the junction box metal chassis.
